TACTICAL ASSAULT SYSTEMS

Designed for those who serve

**RRP CATALOGUE
2024**

Dear valued stockist,

I would like to take this opportunity to thank you for considering and supporting our product range of TAS and other goods.

TAS is an acronym for **Tactical Assault Systems** and is proud to bring this great innovative system to the market. After trial and error we have focused our range on a variation of the “Weave and Tuck” category with a holding stud on the end. This has allowed for the development of a simple to use system of MOLLE and PALS compatible equipment that will allow all scouts, cadets, hunters, fishermen and outdoor enthusiasts to benefit from a simple to use modular building weight bearing range of packs, harnesses, pouches and other load bearing devices.

At TAS we are proud of our achievements and will continue to work hard and diligently in continuing to produce improved load bearing systems. We thank our retail business partners in their invaluable support and feed back in allowing us to work towards creating the best range of products we can for the growing market.

Below is a brief explanation of MOLLE and PALS

MOLLE (Military)

MOLLE is pronounced like the feminine name “Molly” and is an acronym for:

**Modular
Lightweight
Load-carrying
Equipment.**

MOLLE is currently used by the United States Military among others and is the term now used to define current generation of load bearing equipment being utilized by the modern military and is derived from the use of **PALS** another acronym meaning: **Pouch Attachment Ladder Systems**. (Rows of heavy-duty nylon stitched onto a vest or area of pack etc that may allow for the attachment of pouches accessories etc. The MOLLE and PALS system has become the standard for all quality modular military gear.

MOLLE was first introduced into the US military in 1997 and evolved through a series of trial and error R and D, which eventually led to the widespread issue to military personnel post September 11 2001.

MOLLE systems are currently used by military and private security in Iraq and Afghanistan. Thanking you for your support

Best regards

Byron Neophytou

General Manager
TAS

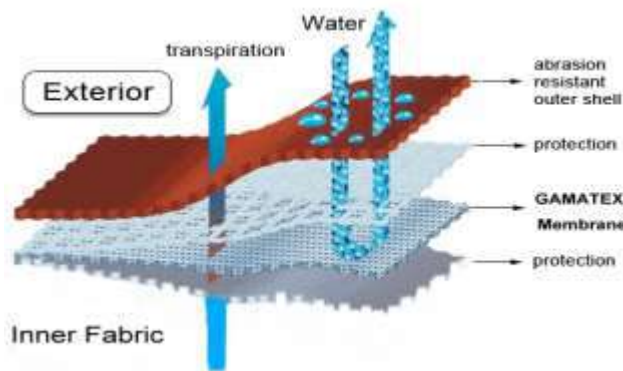

T.A.S - Gammatex Bivy Bag.

What is Gammatex?

Gammatex is a fabric designed by and made exclusively for T.A.S Australia P/ltd, which has taken over 14 months of development to create.

Gammatex is a waterproof fabric that breathes which will help to alleviate moisture build up inside the bag. It does this through a unique three-layer fabric system with the core being a TPU membrane, which will breathe at a rate of a minimum 5000gsm/ 24hrs per square meter. This membrane is sandwiched in between the outer and inner fabrics, which forms the basis of our three-layer fabric. Please refer to the diagram below.

TAS Australia P/Ltd has created a waterproof outer shell with a 10,000 water head rating combined with great breathability. To further ensure waterproof ness we have taped all major stitching points with a waterproof tape, added a storm flap over the zips and used a more generous cut to create a larger bivy bag.

How does Gammatex really work?

It's quite simple but intricate to create. It works by the pressure inside the bivy bag being greater than that outside the bivy bag. The pressure is created through temperature, which means the inside of the bivy bag is warmer than the outside. We also know the body gives off moisture through the skin and this moisture is moving away from the skin to reach the outer part of the bag. The Gammatex membrane allows this moisture to move through the fabric to outer part of the bivy bag while at the same time not allowing any water to penetrate the outer shell. Gammatex works well in conditions that are mild to cold, and even though it would work, Gammatex would be far less effective in the tropics where generally temperatures are above 25 degrees.
